

Getting started 1 (Installation)

Prerequisites

- **OpenMP** - **OpenMP** is a portable API for shared-memory parallel programming. It is supported by most modern compilers. For more information, see the **OpenMP** website.
- **tables/matrix_vector_results.csv** - This file contains the results of the matrix-vector multiplication. It is generated by the **tables/matrix_vector_summary.csv** script. For more information, see the **tables/matrix_vector_summary.csv** file.
- **plot_results.py** - This script generates a PDF file from the results. For more information, see the **plot_results.py** file.

Building and running the program

- **Building** - Use **CMake** to build the program. For more information, see the **CMake** website.
- **Running** - Use the **gather_node_info.sh** script to gather node information. For more information, see the **gather_node_info.sh** file.
- **Options** - The program supports several options: **20000x20000**, **40000x40000**, **1**, **2**, **4**, **7**, **8**, **16**, **20**, **40**. For more information, see the **gather_node_info.sh** file.
- **Output** - The program generates a PDF file. For more information, see the **plot_results.py** file.
